*IKK- $\alpha$  Proteins, Nucleic Acids and Methods*

## INTRODUCTION

Field of the Invention

The field of this invention is proteins involved in transcription factor activation.

Background

Cytokines trigger changes in gene expression by modifying the activity of otherwise latent transcription factors (Hill and Treisman, 1995). Nuclear factor  $\kappa$ B (NF- $\kappa$ B) is a prominent example of how such an external stimulus is converted into an active transcription factor (Verma et al., 1995). The NF- $\kappa$ B system is composed of homo- and heterodimers of members of the Rel family of related transcription factors that control the expression of numerous immune and inflammatory response genes as well as important viral genes (Lenardo and Baltimore, 1989; Baeuerle and Henkel, 1994). The activity of NF- $\kappa$ B transcription factors is regulated by their subcellular localization (Verma et al., 1995). In most cell types, NF- $\kappa$ B is present as a heterodimer comprising of a 50 kDa and a 65 kDa subunit. This heterodimer is sequestered in the cytoplasm in association with I $\kappa$ B $\alpha$  a member of the I $\kappa$ B family of inhibitory proteins (Finco and Baldwin, 1995; Thanos and Maniatis, 1995; Verma et al., 1995). I $\kappa$ B $\alpha$  masks the nuclear localization signal of NF- $\kappa$ B and thereby prevents NF- $\kappa$ B nuclear translocation. Conversion of NF- $\kappa$ B into an active transcription factor that translocates into the nucleus and binds to cognate DNA sequences requires the phosphorylation and subsequent ubiquitin-dependent degradation of I $\kappa$ B $\alpha$  in the 26s proteasome. Signal-induced phosphorylation of I $\kappa$ B $\alpha$  occurs at serines 32 and 36. Mutation of one or both of these serines renders I $\kappa$ B $\alpha$  resistant to ubiquitination and proteolytic degradation (Chen et al., 1995).

The pleiotropic cytokines tumor necrosis factor (TNF) and interleukin-1 (IL-1) are among the physiological inducers of I $\kappa$ B phosphorylation and subsequent NF- $\kappa$ B activation (Osborn et al., 1989; Beg et al., 1993). Although TNF and IL-1 initiate signaling cascades leading to NF- $\kappa$ B activation via distinct families of cell-surface receptors (Smith et al., 1994; Dinarello, 1996), both pathways utilize members of the TNF receptor-associated factor (TRAF) family of adaptor proteins as signal transducers (Rothe et al., 1995; Hsu et al., 1996; Cao et al., 1996b). TRAF proteins were originally found to

associate directly with the cytoplasmic domains of several members of the TNF receptor family including the 75 kDa TNF receptor (TNFR2), CD40, CD30, and the lymphotoxin- $\beta$  receptor (Rothe et al., 1994; Hu et al., 1994; Cheng et al., 1995; Mosialos et al., 1995; Song and Donner, 1995; Sato et al., 1995; Lee et al., 1996; Gedrich et al., 1996; Ansieau et al., 1996). In addition, TRAF proteins are recruited indirectly to the 55 kDa TNF receptor (TNFR1) by the adaptor protein TRADD (Hsu et al., 1996). Activation of NF- $\kappa$ B by TNF requires TRAF2 (Rothe et al., 1995; Hsu et al., 1996). TRAF5 has also been implicated in NF- $\kappa$ B activation by members of the TNF receptor family (Nakano et al., 1996). In contrast, TRAF6 participates in NF- $\kappa$ B activation by IL-1 (Cao et al., 1996b). Upon IL-1 treatment, TRAF6 associates with IRAK, a serine-threonine kinase that binds to the IL-1 receptor complex (Cao et al., 1996a).

The NF- $\kappa$ B-inducing kinase (NIK) is a member of the MAP kinase kinase kinase (MAP3K) family that was identified as a TRAF2-interacting protein (Malinin et al., 1997). NIK activates NF- $\kappa$ B when overexpressed, and kinase-inactive mutants of NIK comprising its TRAF2-interacting C-terminal domain (NIK<sub>(624-947)</sub>) or lacking two crucial lysine residues in its kinase domain (NIK<sub>(KK429-430AA)</sub>) behave as dominant-negative inhibitors that suppress TNF-, IL-1-, and TRAF2-induced NF- $\kappa$ B activation (Malinin et al., 1997). Recently, NIK was found to associate with additional members of the TRAF family, including TRAF5 and TRAF6. Catalytically inactive mutants of NIK also inhibited TRAF5- and TRAF6-induced NF- $\kappa$ B activation, thus providing a unifying concept for NIK as a common mediator in the NF- $\kappa$ B signaling cascades triggered by TNF and IL-1 downstream of TRAFs.

Here, we disclose a novel human kinase I $\kappa$ B Kinase, IKK- $\alpha$ , as a NIK-interacting protein. IKK- $\alpha$  has sequence similarity to the conceptual translate of a previously identified open reading frame (SEQ ID NO:5) postulated to encode a serine-threonine kinase of unknown function ('Conserved Helix-loop-helix Ubiquitous Kinase' or CHUK, Connelly and Marcu, 1995; Mock et al., 1995). Catalytically inactive mutants of IKK- $\alpha$  are shown to suppress NF- $\kappa$ B activation induced by TNF and IL-1 stimulation as well as by TRAF and NIK overexpression; transiently expressed IKK- $\alpha$  is shown to associate with the endogenous I $\kappa$ B $\alpha$  complex; and IKK- $\alpha$  is shown to phosphorylate I $\kappa$ B $\alpha$  on serines 32 and 36.

## SUMMARY OF THE INVENTION

The invention provides methods and compositions relating to isolated IKK- $\alpha$  polypeptides, related nucleic acids, polypeptide domains thereof having IKK- $\alpha$ -specific structure and activity and modulators of IKK- $\alpha$  function, particularly I $\kappa$ B kinase activity. IKK- $\alpha$  polypeptides can regulate NF $\kappa$ B activation and hence provide important regulators of cell function. The polypeptides may be produced recombinantly from transformed host cells from the subject IKK- $\alpha$  polypeptide encoding nucleic acids or purified from mammalian cells. The invention provides isolated IKK- $\alpha$  hybridization probes and primers capable of specifically hybridizing with the disclosed IKK- $\alpha$  gene, IKK- $\alpha$ -specific binding agents such as specific antibodies, and methods of making and using the subject compositions in diagnosis (e.g. genetic hybridization screens for IKK- $\alpha$  transcripts), therapy (e.g. IKK- $\alpha$  kinase inhibitors to inhibit TNF signal transduction) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating other transcriptional regulators, reagents for screening chemical libraries for lead pharmacological agents, etc.).

## DETAILED DESCRIPTION OF THE INVENTION

The nucleotide sequence of a natural cDNA encoding a human IKK- $\alpha$  polypeptide is shown as SEQ ID NO:3, and the full conceptual translate is shown as SEQ ID NO:4. The IKK- $\alpha$  polypeptides of the invention include incomplete translates of SEQ ID NO:3, particularly of SEQ ID NO:3, residues 1-638, which translates and deletion mutants of SEQ ID NO:4 have human IKK- $\alpha$ -specific amino acid sequence, binding specificity or function and comprise at least one of Cys30, GluLeu604, Thr679, Ser680, Pro684, Thr686, and Ser678. Preferred translates/deletion mutants comprise at least a 6 residue Cys30, Glu543, Leu604, Thr679, Ser680, Pro684, Thr686 or Ser687-containing domain of SEQ ID NO:4, preferably including at least 8, more preferably at least 12, most preferably at least 20 contiguous residues which immediately flank said residue, with said residue preferably residing within said contiguous residues, see, e.g. Table I; which mutants provide hIKK- $\alpha$  specific epitopes and immunogens.

TABLE 1. Exemplary IKK- $\alpha$  polypeptides having IKK- $\alpha$  binding specificity

hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 1-30) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 686-699)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 22-31) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 312-345)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 599-608) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 419-444)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 601-681) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 495-503)  
5 hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 604-679) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 565-590)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 670-687) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 610-627)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 679-687) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 627-638)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 680-690) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 715-740)  
hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 684-695) hIKK- $\alpha\Delta 1$  (SEQ ID NO:4, residues 737-745)

10 The subject domains provide IKK- $\alpha$  domain specific activity or function, such as  
IKK- $\alpha$ -specific kinase or kinase inhibitory activity, NIK-binding or binding inhibitory  
activity, I $\kappa$ B-binding or binding inhibitory activity, NF $\kappa$ B activating or inhibitory activity  
or antibody binding. Preferred domains phosphorylate at least one and preferably both the  
serine 32 and 36 of I $\kappa$ B (Verma, I. M., et al. (1995)). As used herein, Ser32 and Ser36 of  
15 I $\kappa$ B refers collectively to the two serine residues which are part of the consensus sequence  
DSGL/IXSM/L (e.g. ser 32 and 36 in I $\kappa$ B $\alpha$ , ser 19 and 23 in I $\kappa$ B $\beta$ , and ser 157 and 161,  
or 18 and 22, depending on the usage of methionines, in I $\kappa$ B $\epsilon$ , respectively.

IKK- $\alpha$ -specific activity or function may be determined by convenient *in vitro*, cell-  
based, or *in vivo* assays: e.g. *in vitro* binding assays, cell culture assays, in animals (e.g.  
20 gene therapy, transgenics, etc.), etc. Binding assays encompass any assay where the  
molecular interaction of an IKK- $\alpha$  polypeptide with a binding target is evaluated. The  
binding target may be a natural intracellular binding target such as an IKK- $\alpha$  substrate, a  
IKK- $\alpha$  regulating protein or other regulator that directly modulates IKK- $\alpha$  activity or its  
localization; or non-natural binding target such a specific immune protein such as an  
25 antibody, or an IKK- $\alpha$  specific agent such as those identified in screening assays such as  
described below. IKK- $\alpha$ -binding specificity may assayed by kinase activity or binding  
equilibrium constants (usually at least about  $10^7$  M $^{-1}$ , preferably at least about  $10^8$  M $^{-1}$ ,  
more preferably at least about  $10^9$  M $^{-1}$ ), by the ability of the subject polypeptide to function  
as negative mutants in IKK- $\alpha$ -expressing cells, to elicit IKK- $\alpha$  specific antibody in a  
30 heterologous host (e.g a rodent or rabbit), etc. In any event, the IKK- $\alpha$  binding specificity

of the subject IKK- $\alpha$  polypeptides necessarily distinguishes the murine and human CHUK sequences of Connelly and Marcu (1995) as well as IKK- $\beta$  (SEQ ID NO:4).

The claimed IKK- $\alpha$  polypeptides are isolated or pure: an "isolated" polypeptide is unaccompanied by at least some of the material with which it is associated in its natural state, preferably constituting at least about 0.5%, and more preferably at least about 5% by weight of the total polypeptide in a given sample and a pure polypeptide constitutes at least about 90%, and preferably at least about 99% by weight of the total polypeptide in a given sample. In a particular embodiment, IKK- $\alpha$  polypeptides are isolated from a MKP-1 precipitable complex, isolated from a IKK complex, and/or isolated from IKK- $\beta$ . The IKK- $\alpha$  polypeptides and polypeptide domains may be synthesized, produced by recombinant technology, or purified from mammalian, preferably human cells. A wide variety of molecular and biochemical methods are available for biochemical synthesis, molecular expression and purification of the subject compositions, see e.g. Molecular Cloning, A Laboratory Manual (Sambrook, *et al.* Cold Spring Harbor Laboratory), Current Protocols in Molecular Biology (Eds. Ausubel, *et al.*, Greene Publ. Assoc., Wiley-Interscience, NY) or that are otherwise known in the art.

The invention provides binding agents specific to IKK polypeptides, preferably the claimed IKK- $\alpha$  polypeptides, including substrates, agonists, antagonists, natural intracellular binding targets, etc., methods of identifying and making such agents, and their use in diagnosis, therapy and pharmaceutical development. For example, specific binding agents are useful in a variety of diagnostic and therapeutic applications, especially where disease or disease prognosis is associated with improper utilization of a pathway involving the subject proteins, e.g. NF- $\kappa$ B activation. Novel IKK-specific binding agents include IKK-specific receptors, such as somatically recombined polypeptide receptors like specific antibodies or T-cell antigen receptors (see, e.g. Harlow and Lane (1988) Antibodies, A Laboratory Manual, Cold Spring Harbor Laboratory) and other natural intracellular binding agents identified with assays such as one-, two- and three-hybrid screens, non-natural intracellular binding agents identified in screens of chemical libraries such as described below, etc. Agents of particular interest modulate IKK function, e.g. IKK-dependent transcriptional activation. For example, a wide variety of inhibitors of IKK I $\kappa$ B kinase activity may be used to regulate signal transduction involving I $\kappa$ B. Exemplary IKK I $\kappa$ B kinase inhibitors include known classes of serine/threonine kinase (e.g. PKC)

inhibitors such as competitive inhibitors of ATP and substrate binding, antibiotics, IKK-derived peptide inhibitors, etc., see Tables II and III. IKK specificity and activity are readily quantified in high throughput kinase assays using panels of protein kinases (see cited references and Examples).

Preferred inhibitors include natural compounds such as staurosporine (Omura S, et al. J Antibiot (Tokyo) 1995 Jul;48(7):535-48), produced by a marine organism, and synthetic compounds such as PD 153035, which also potently inhibits the EGF receptor protein kinase (Fry DW et al. Science 1994 Aug 19;265(5175):1093-5). Members of the tyrphostin family of synthetic protein kinase inhibitors are also useful; these include compounds which are pure ATP competitors, compounds which are pure substrate competitors, and compounds which are mixed competitors: compete with both ATP and substrate (Levitzki A and Gazit A, Science 1995 Mar 24;267(5205):1782-8). Additional IKK inhibitors include peptide-based substrate competitors endogenously made by the mammalian cell, e.g. PKI (protein kinase inhibitor, Seasholtz AF et al., Proc Natl Acad Sci USA 1995 Feb 28;92(5):1734-8), or proteins inhibiting cdc kinases (Correa-Bordes J and Nurse P, Cell 1995 Dec 15;83(6):1001-9). Additional small peptide based substrate competitive kinase inhibitors and allosteric inhibitors (inhibitory mechanisms independent of ATP or substrate competition) are readily generated by established methods (Hvalby O, et al. Proc Natl Acad Sci USA 1994 May 24;91(11):4761-5; Barja P, et al., Cell Immunol 1994 Jan;153(1):28-38; Villar-Palasi C, Biochim Biophys Acta 1994 Dec 30;1224(3):384-8; Liu WZ, et al., Biochemistry 1994 Aug 23;33(33):10120-6).

30 Accordingly, the invention provides methods for modulating signal transduction

involving I $\kappa$ B in a cell comprising the step of modulating IKK kinase activity, e.g. by contacting the cell with a serine/threonine kinase inhibitor. The cell may reside in culture or in situ, i.e. within the natural host. Preferred inhibitors are orally active in mammalian hosts. For diagnostic uses, the inhibitors or other IKK binding agents are frequently labeled, such as with fluorescent, radioactive, chemiluminescent, or other easily detectable molecules, either conjugated directly to the binding agent or conjugated to a probe specific for the binding agent.

The amino acid sequences of the disclosed IKK- $\alpha$  polypeptides are used to back-translate IKK- $\alpha$  polypeptide-encoding nucleic acids optimized for selected expression systems (Holler et al. (1993) Gene 136, 323-328; Martin et al. (1995) Gene 154, 150-166) or used to generate degenerate oligonucleotide primers and probes for use in the isolation of natural IKK- $\alpha$ -encoding nucleic acid sequences ("GCG" software, Genetics Computer Group, Inc, Madison WI). IKK- $\alpha$ -encoding nucleic acids used in IKK- $\alpha$ -expression vectors and incorporated into recombinant host cells, e.g. for expression and screening, transgenic animals, e.g. for functional studies such as the efficacy of candidate drugs for disease associated with IKK- $\alpha$ -modulated cell function, etc.

The invention also provides nucleic acid hybridization probes and replication / amplification primers having a IKK- $\alpha$  cDNA specific sequence comprising at least 12, preferably at least 24, more preferably at least 36 and most preferably at least contiguous 96 bases of a strand of SEQ ID NO:3, particularly of SEQ ID NO:2, nucleotides 1-1913, and preferably including at least one of bases 1-92, 1811, 1812, 1992, 1995, 2034, 2035, 2039, 2040, 2050, 2055 and 2060, and sufficient to specifically hybridize with a second nucleic acid comprising the complementary strand of SEQ ID NO:3 in the presence of a third nucleic acid comprising (SEQ ID NO:5). Demonstrating specific hybridization generally requires stringent conditions, for example, hybridizing in a buffer comprising 30% formamide in 5 x SSPE (0.18 M NaCl, 0.01 M NaPO<sub>4</sub>, pH7.7, 0.001 M EDTA) buffer at a temperature of 42°C and remaining bound when subject to washing at 42°C with 0.2 x SSPE; preferably hybridizing in a buffer comprising 50% formamide in 5 x SSPE buffer at a temperature of 42°C and remaining bound when subject to washing at 42°C with 0.2 x SSPE buffer at 42°C. IKK- $\alpha$  nucleic acids can also be distinguished using alignment algorithms, such as BLASTX (Altschul *et al.* (1990) Basic Local Alignment Search Tool, J Mol Biol 215, 403-410).

The subject nucleic acids are of synthetic/non-natural sequences and/or are isolated, i.e. unaccompanied by at least some of the material with which it is associated in its natural state, preferably constituting at least about 0.5%, preferably at least about 5% by weight of total nucleic acid present in a given fraction, and usually recombinant, meaning they comprise a non-natural sequence or a natural sequence joined to nucleotide(s) other than that which it is joined to on a natural chromosome. Recombinant nucleic acids comprising the nucleotide sequence of SEQ ID NO:3, or requisite fragments thereof, contain such sequence or fragment at a terminus, immediately flanked by (i.e. contiguous with) a sequence other than that which it is joined to on a natural chromosome, or flanked by a native flanking region fewer than 10 kb, preferably fewer than 2 kb, which is at a terminus or is immediately flanked by a sequence other than that which it is joined to on a natural chromosome. While the nucleic acids are usually RNA or DNA, it is often advantageous to use nucleic acids comprising other bases or nucleotide analogs to provide modified stability, etc.

The subject nucleic acids find a wide variety of applications including use as translatable transcripts, hybridization probes, PCR primers, diagnostic nucleic acids, etc.; use in detecting the presence of IKK- $\alpha$  genes and gene transcripts and in detecting or amplifying nucleic acids encoding additional IKK- $\alpha$  homologs and structural analogs. In diagnosis, IKK- $\alpha$  hybridization probes find use in identifying wild-type and mutant IKK- $\alpha$  alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses. In therapy, therapeutic IKK- $\alpha$  nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active IKK- $\alpha$ .

The invention provides efficient methods of identifying agents, compounds or lead compounds for agents active at the level of a IKK modulatable cellular function.

Generally, these screening methods involve assaying for compounds which modulate IKK interaction with a natural IKK binding target, in particular, IKK phosphorylation of I $\kappa$ B-derived substrates, particularly I $\kappa$ B and NIK substrates. A wide variety of assays for binding agents are provided including labeled *in vitro* protein-protein binding assays, immunoassays, cell based assays, etc. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for lead compounds. Identified reagents find use in the pharmaceutical industries for animal and human trials; for example,

the reagents may be derivatized and rescreened in *in vitro* and *in vivo* assays to optimize activity and minimize toxicity for pharmaceutical development.

*In vitro* binding assays employ a mixture of components including an IKK polypeptide, which may be part of a fusion product with another peptide or polypeptide, e.g. a tag for detection or anchoring, etc. The assay mixtures comprise a natural intracellular IKK binding target. In a particular embodiment, the binding target is a substrate comprising I $\kappa$ B serines 32 and/or 36. Such substrates comprise a I $\kappa$ B $\alpha$ ,  $\beta$  or  $\epsilon$  peptide including the serine 32 and/or 36 residue and at least 5, preferably at least 10, and more preferably at least 20 naturally occurring immediately flanking residues on each side (e.g. for serine 36 peptides, residues 26-46, 22-42, or 12-32 or 151-171 for I $\kappa$ B $\alpha$ ,  $\beta$  or  $\epsilon$  - derived substrates, respectively). While native full-length binding targets may be used, it is frequently preferred to use portions (e.g. peptides) thereof so long as the portion provides binding affinity and avidity to the subject IKK polypeptide conveniently measurable in the assay. The assay mixture also comprises a candidate pharmacological agent. Candidate agents encompass numerous chemical classes, though typically they are organic compounds; preferably small organic compounds and are obtained from a wide variety of sources including libraries of synthetic or natural compounds. A variety of other reagents may also be included in the mixture. These include reagents like ATP or ATP analogs (for kinase assays), salts, buffers, neutral proteins, e.g. albumin, detergents, protease inhibitors, nuclease inhibitors, antimicrobial agents, etc. may be used.

The resultant mixture is incubated under conditions whereby, but for the presence of the candidate pharmacological agent, the IKK polypeptide specifically binds the cellular binding target, portion or analog with a reference binding affinity. The mixture components can be added in any order that provides for the requisite bindings and incubations may be performed at any temperature which facilitates optimal binding. Incubation periods are likewise selected for optimal binding but also minimized to facilitate rapid, high-throughput screening.

After incubation, the agent-biased binding between the IKK polypeptide and one or more binding targets is detected by any convenient way. For IKK kinase assays, 'binding' is generally detected by a change in the phosphorylation of a IKK- $\alpha$  substrate. In this embodiment, kinase activity may quantified by the transfer to the substrate of a labeled phosphate, where the label may provide for direct detection as radioactivity, luminescence,

optical or electron density, etc. or indirect detection such as an epitope tag, etc. A variety of methods may be used to detect the label depending on the nature of the label and other assay components, e.g. through optical or electron density, radiative emissions, nonradiative energy transfers, etc. or indirectly detected with antibody conjugates, etc.

5 A difference in the binding affinity of the IKK polypeptide to the target in the absence of the agent as compared with the binding affinity in the presence of the agent indicates that the agent modulates the binding of the IKK polypeptide to the IKK binding target. Analogously, in the cell-based assay also described below, a difference in IKK- $\alpha$ -dependent transcriptional activation in the presence and absence of an agent indicates the agent modulates IKK function. A difference, as used herein, is statistically significant and  
10 preferably represents at least a 50%, more preferably at least a 90% difference.

The following experimental section and examples are offered by way of illustration and not by way of limitation.

## EXPERIMENTAL

### 15 Identification of IKK- $\alpha$

To investigate the mechanism of NIK-mediated NF- $\kappa$ B activation, we identified proteins that associate directly with NIK by yeast two-hybrid protein interaction cloning (Fields and Song, 1989). An expression vector was generated that encodes NIK fused to the DNA-binding domain of the yeast transcription factor GAL4. This vector was used as bait in  
20 a two-hybrid screen of a human B cell cDNA library. From approximately six million transformants, eight positive clones were obtained, as determined by activation of *his* and *lacZ* reporter genes. Of these clones, three encoded a member of the TRAF family, TRAF3 (Hu et al., 1994; Cheng et al., 1995; Mosialos et al., 1995; Sato et al., 1995) and one encoded a novel protein we call IKK- $\alpha$ . Retransformation into yeast cells verified the interaction between  
25 NIK and IKK- $\alpha$ . A full-length human IKK- $\alpha$  clone was isolated by screening a Jurkat cDNA library with a probe generated from the 5'-end of the IKK- $\alpha$  two-hybrid clone. IKK- $\alpha$  comprises an N-terminal serine-threonine kinase catalytic domain, a C-terminal helix-loop-helix domain and a leucine zipper-like amphipathic  $\alpha$ -helix juxtaposed in between the helix-loop-helix and kinase domain.

### 30 Interaction of IKK- $\alpha$ and NIK in Human Cells

The interaction of IKK- $\alpha$  with NIK was confirmed in mammalian cell

coimmunoprecipitation assays. Human IKK- $\alpha$  containing an N-terminal Flag epitope tag was transiently coexpressed in 293 human embryonic kidney cells with Myc epitope-tagged NIK or HA epitope-tagged TRAF proteins. Cell lysates were immunoprecipitated using a monoclonal antibody against the Flag epitope, and coprecipitating NIK or TRAF proteins were detected by immunoblot analysis with an anti-Myc or anti-HA monoclonal antibodies.

5 In this assay, IKK- $\alpha$  was able to coprecipitate NIK confirming the interaction between both proteins as detected for IKK- $\alpha$  by yeast two-hybrid analysis. Also, a deletion mutant IKK- $\alpha$  protein lacking most of the N-terminal kinase domain (IKK- $\alpha_{(307-745)}$ ) was able to associate with NIK, indicating that the  $\alpha$ -helical C-terminal half of IKK- $\alpha$  mediates the interaction with NIK. In contrast to NIK, IKK- $\alpha$  failed to associate with either TRAF2 or TRAF3. However,  
10 when NIK was coexpressed with IKK- $\alpha$  and TRAF2, strong coprecipitation of TRAF2 with IKK- $\alpha$  was detected, indicating the formation of a ternary complex between IKK- $\alpha$ , NIK and TRAF2.

#### Effect of IKK- $\alpha$ and IKK- $\alpha$ Mutants on NF- $\kappa$ B Activation

To investigate a possible role for IKK- $\alpha$  in NF- $\kappa$ B activation, we examined if transient  
15 overexpression of IKK- $\alpha$  might activate an NF- $\kappa$ B-dependent reporter gene. An E-selectin-luciferase reporter construct (Schindler and Baichwal, 1994) and a IKK- $\alpha$  expression vector were cotransfected into HeLa cells. IKK- $\alpha$  expression activated the reporter gene in a dose-dependent manner, with a maximal induction of luciferase activity of about 6 to 7-fold compared to vector control. Similar results were obtained in 293 cells, where IKK- $\alpha$   
20 overexpression induced reporter gene activity approximately 4-fold. TNF treatment did not stimulate the weak NF- $\kappa$ B-inducing activity of overexpressed IKK- $\alpha$  in reporter gene assays. Thus, IKK- $\alpha$  induces NF- $\kappa$ B activation when overexpressed.

We next determined the effect of overexpression of kinase-inactive IKK- $\alpha_{(307-745)}$  that still associates with NIK on signal-induced NF- $\kappa$ B activation in reporter gene assays in  
25 293 cells. Overexpression of IKK- $\alpha_{(307-745)}$  blocked TNF- and IL-1-induced reporter gene activation similar to overexpression of NIK $_{(624-947)}$ . IKK- $\alpha_{(307-745)}$  was also found to inhibited NF- $\kappa$ B-dependent reporter gene activity elicited by overexpression of TRAF2, TRAF6 and NIK. Taken together these results demonstrate that a catalytically inactive IKK- $\alpha$  mutant is a dominant-negative inhibitor of TNF-, IL-1, TRAF- and NIK-induced NF- $\kappa$ B  
30 activation. This indicates that IKK- $\alpha$  functions as a common mediator of NF- $\kappa$ B activation by TNF and IL-1 downstream of NIK.

## EXAMPLES

1. Protocol for at IKK- $\alpha$  - I $\kappa$ B $\alpha$  phosphorylation assay.

## A. Reagents:

- Neutralite Avidin: 20  $\mu$ g/ml in PBS.

- kinase:  $10^{-8}$  -  $10^{-5}$  M IKK- $\alpha$  (SEQ ID NO:4) at 20  $\mu$ g/ml in PBS.

5 - substrate:  $10^{-7}$  -  $10^{-4}$  M biotinylated substrate (21 residue peptide consisting of residues 26-46 of human I $\kappa$ B $\alpha$ ) at 40  $\mu$ g/ml in PBS.

- Blocking buffer: 5% BSA, 0.5% Tween 20 in PBS; 1 hour at room temperature.

10 - Assay Buffer: 100 mM KCl, 10 mM MgCl<sub>2</sub>, 1 mM MnCl<sub>2</sub>, 20 mM HEPES pH 7.4, 0.25 mM EDTA, 1% glycerol, 0.5% NP-40, 50 mM BME, 1 mg/ml BSA, cocktail of protease inhibitors.

- [<sup>32</sup>P] $\gamma$ -ATP 10x stock:  $2 \times 10^{-5}$  M cold ATP with 100  $\mu$ Ci [<sup>32</sup>P] $\gamma$ -ATP. Place in the 4°C microfridge during screening.

15 - Protease inhibitor cocktail (1000X): 10 mg Trypsin Inhibitor (BMB # 109894), 10 mg Aprotinin (BMB # 236624), 25 mg Benzamidine (Sigma # B-6506), 25 mg Leupeptin (BMB # 1017128), 10 mg APMSF (BMB # 917575), and 2mM NaVO<sub>3</sub> (Sigma # S-6508) in 10 ml of PBS.

## B. Preparation of assay plates:

- Coat with 120  $\mu$ l of stock N Avidin per well overnight at 4°C.

- Wash 2 times with 200  $\mu$ l PBS.

20 - Block with 150  $\mu$ l of blocking buffer.

- Wash 2 times with 200  $\mu$ l PBS.

## C. Assay:

- Add 40  $\mu$ l assay buffer/well.

- Add 40  $\mu$ l biotinylated substrate (2-200 pmoles/40  $\mu$ l in assay buffer)

25 - Add 40  $\mu$ l kinase (0.1-10 pmoles/40  $\mu$ l in assay buffer)

- Add 10  $\mu$ l compound or extract.

- Add 10  $\mu$ l [<sup>32</sup>P] $\gamma$ -ATP 10x stock.

- Shake at 25°C for 15 minutes.

- Incubate additional 45 minutes at 25°C.

30 - Stop the reaction by washing 4 times with 200  $\mu$ l PBS.

- Add 150  $\mu$ l scintillation cocktail.

- Count in Topcount.

D. Controls for all assays (located on each plate):

- a. Non-specific binding
- b. cold ATP at 80% inhibition.

5      2. Protocol for high throughput IKK- $\alpha$ -NIK binding assay.

A. Reagents:

- Neutralite Avidin: 20  $\mu$ g/ml in PBS.
- Blocking buffer: 5% BSA, 0.5% Tween 20 in PBS; 1 hour at room temperature.
- Assay Buffer: 100 mM KCl, 20 mM HEPES pH 7.6, 1 mM MgCl<sub>2</sub>, 1% glycerol,  
10      0.5% NP-40, 50 mM  $\beta$ -mercaptoethanol, 1 mg/ml BSA, cocktail of protease inhibitors.
- <sup>33</sup>P IKK- $\alpha$  polypeptide 10x stock: 10<sup>-8</sup> - 10<sup>-6</sup> M "cold" IKK- $\alpha$  supplemented with 200,000-250,000 cpm of labeled IKK- $\alpha$  (Beckman counter). Place in the 4°C microfridge during screening.
- Protease inhibitor cocktail (1000X): 10 mg Trypsin Inhibitor (BMB # 109894), 10  
15      mg Aprotinin (BMB # 236624), 25 mg Benzamidine (Sigma # B-6506), 25 mg Leupeptin (BMB # 1017128), 10 mg APMSF (BMB # 917575), and 2mM NaVO<sub>3</sub> (Sigma # S-6508) in 10 ml of PBS.

- NIK: 10<sup>-7</sup> - 10<sup>-5</sup> M biotinylated NIK in PBS.

B. Preparation of assay plates:

- 20      - Coat with 120  $\mu$ l of stock N-Avidin per well overnight at 4°C.
- Wash 2 times with 200  $\mu$ l PBS.
- Block with 150  $\mu$ l of blocking buffer.
- Wash 2 times with 200  $\mu$ l PBS.

C. Assay:

- 25      - Add 40  $\mu$ l assay buffer/well.
- Add 10  $\mu$ l compound or extract.
- Add 10  $\mu$ l <sup>33</sup>P-IKK- $\alpha$  (20-25,000 cpm/0.1-10 pmoles/well = 10<sup>-9</sup> - 10<sup>-7</sup> M final conc).
- Shake at 25°C for 15 minutes.
- Incubate additional 45 minutes at 25°C.
- 30      - Add 40  $\mu$ M biotinylated NIK (0.1-10 pmoles/40  $\mu$ l in assay buffer)
- Incubate 1 hour at room temperature.

- Stop the reaction by washing 4 times with 200  $\mu$ M PBS.
- Add 150  $\mu$ M scintillation cocktail.
- Count in Topcount.

D. Controls for all assays (located on each plate):

- a. Non-specific binding
- 5           b. Soluble (non-biotinylated NIK) at 80% inhibition.

10           All publications and patent applications cited in this specification are herein incorporated by reference as if each individual publication or patent application were specifically and individually indicated to be incorporated by reference. Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, it will be readily apparent to those of ordinary skill in the art in light of the teachings of this invention that certain changes and modifications may be made thereto without departing from the spirit or scope of the appended claims.

## WHAT IS CLAIMED IS:

1. An isolated polypeptide comprising SEQ ID NO:4, or at least a 10 residue domain thereof comprising at least one of Cys30, Leu604, Thr679, Ser680, Pro684, Thr686 and Ser678.
- 5 2. An isolated polypeptide according to claim 1, wherein said polypeptide has an activity selected from at least one of: a kinase or kinase inhibitory activity, a NIK-binding or binding inhibitory activity, an I $\kappa$ B-binding or binding inhibitory activity and an NF $\kappa$ B activating or inhibitory activity.
- 10 3. An isolated or recombinant first nucleic acid comprising a strand of SEQ ID NO:3, or a portion thereof having at least 24 contiguous bases of SEQ ID NO:3 and including at least one of bases 1-92, 1811, 1812, 1992, 1995, 2034, 2035, 2039, 2040, 2050, 2055 and 2060, sufficient to specifically hybridize with a second nucleic acid comprising the complementary strand of SEQ ID NO:3 in the presence of a third nucleic acid comprising  
15 (SEQ ID NO:5).
4. A recombinant nucleic acid encoding a polypeptide according to claim 1.
5. A cell comprising a nucleic acid according to claim 4.
- 20 6. A method of making an isolated polypeptide according to claim 1, said method comprising steps: introducing a nucleic acid according to claim 4 into a host cell or cellular extract, incubating said host cell or extract under conditions whereby said nucleic acid is expressed as a transcript and said transcript is expressed as a translation product comprising  
25 said polypeptide, and isolating said translation product.
7. A method of screening for an agent which modulates the interaction of an IKK polypeptide to a binding target, said method comprising the steps of:  
incubating a mixture comprising:  
30 an isolated polypeptide according to claim 1,  
a binding target of said polypeptide, and

a candidate agent;

under conditions whereby, but for the presence of said agent, said polypeptide specifically binds said binding target at a reference affinity;

detecting the binding affinity of said polypeptide to said binding target to determine an agent-biased affinity, wherein a difference between the agent-biased affinity and the reference affinity indicates that said agent modulates the binding of said polypeptide to said binding target.

8. A method according to claim 7, wherein said binding target is a natural intracellular substrate and said reference and agent-biased binding affinity is detected as phosphorylation of said substrate.

9. A method of screening for an agent which modulates the interaction of an IKK polypeptide to a binding target, said method comprising the steps of:

incubating a mixture comprising: an isolated polypeptide comprising SEQ ID NO: 2 or 4, or a deletion mutant thereof retaining I $\kappa$ B kinase activity, an I $\kappa$ B polypeptide comprising at least a six residue domain of a natural I $\kappa$ B comprising at least one of Ser32 and Ser 36, and a candidate agent;

under conditions whereby, but for the presence of said agent, said polypeptide specifically phosphorylates said I $\kappa$ B polypeptide at at least one of said Ser32 and Ser36 at a reference activity;

detecting the polypeptide-induced phosphorylation of said I $\kappa$ B polypeptide at at least one of said Ser32 and Ser36 to determine an agent-biased activity, wherein a difference between the agent-biased activity and the reference activity indicates that said agent modulates the ability of said polypeptide to specifically phosphorylate a I $\kappa$ B polypeptide.

10. A method for modulating signal transduction involving I $\kappa$ B in a cell, said method comprising the step of modulating IKK- $\alpha$  (SEQ ID NO:4) kinase activity.

11. The method of claim 10, wherein said modulating step comprises contacting the cell with a serine/threonine kinase inhibitor.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US98/13782

**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(6) :C12N 9/12; C12Q 1/48

US CL :435/15, 194

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 435/15, 194

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, CAPLUS

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	MOCK, B.A., et al. CHUK, A Conserved Helix-Loop-Helix Ubiquitous Kinase, Maps To Human Chromosome 10 And Mouse Chromosome 19. Genomics. 1995, Vol. 27, pages 348-351, see entire document, especially attached sequence data.	1,2
X - Y	TRAENCKNER, E.B-M. et al. Phosphorylation Of Human IκB-Alpha On Serines 32 and 36 Controls IκB-Alpha Proteolysis And NF-κB Activation In Response To Diverse Stimuli. EMBO J. 1995, Vol. 14, No. 12, pages 2876-2883. See entire document	1,2 ----- 7-9

☒ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*B* earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*A* document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means	
*P* document published prior to the international filing date but later than the priority date claimed

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US98/13782

## BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claims 1-2 and 7-9, drawn to a isolated polypeptide (IKK- $\alpha$ ) and a method of using the polypeptide to screen for modulation of IKK.

Group II, claims 3-6, drawn to a nucleic acid, a cell containing the nucleic acid and a method of using the nucleic acid to make a polypeptide.

Group III, claims 10-11, drawn to a method of modulating signal transduction.

The inventions listed as Groups I-III do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

Groups I and II are completely different chemical compounds, one being a polypeptide and the other being a nucleic acid. Group III is a method involving modulating IKK- $\alpha$  to modulate signal transduction. This is different from the method of Group I which is a method of screening.
